Front End: HTML

Back End: Python

For the prototype we decided to use HTML and Python because our team is more well versed in them and because we can use Python for a bit of front end if needed. When looking at which languages to use we knew we wanted to keep it simple (KISS), and so HTML and Python matched up with that thought as well. We didn't want to get too absorbed with syntax and so we decided to stray away from using Java, which is something we considered using at some point in our discussion. Also since HTML is known as the backbone of front end languages, we thought that it would be simplest to use that one. We wanted to spend more time on the ideas and goals of the project than the nitty gritty parts of coding it into existence.
